

- d**
- ### Take-home
- **Monocyte AD > Control direction is preserved** in 4/4 (cohort × method) tests.
 - **Monocyte $r(\text{method vs Danaher})$ median 0.54**; Bisque achieves 0.51 (GSE63060) and 0.56 (GSE63061); MuSiC 0.32 and 0.63.
 - **Cross-method numerical disagreement is expected** for T-cell subsets and B cells — Danaher marker panels and PBMC scRNA references resolve different sub-populations.
 - **The audit's central claim — that the AD blood signal tracks myeloid composition** — does not depend on the deconvolution method: all three methods agree on the monocyte shift.
 - **Caveat: PBMC reference has no neutrophils**; neutrophil cannot be cross-validated here.
